

How to read barometric pressure on your SUN altimeter/barometer:

First, look at the face of your altimeter gauge. Does your altimeter measure in **feet** (0 to 15,000) or in **meters** (0 to 5000)?

- A. If in **meters**, please refer to **Section II** below.
- B. If in **feet**, we must first determine whether you have a **NEWER** or **OLDER** model (this applies to “feet” version only):
 1. If you have a **NEWER** model, it will have an **orange Index line**, located just under the “0 FT” printed on the dial (see diagram below).
 2. If you have an **OLDER** model, it will **NOT** have the orange Index line shown diagram below.

- C. If you have **NEWER** model (feet version), please refer to **Section I** below.
If you have an **OLDER** model (feet version), please refer to **Section II** below.

Section I: If you have NEWER “feet” model (with Index mark):

Note that you do **NOT** use the black indicator needle to read barometric pressure. The black indicator needle is only used to read altitude. Use the orange Index line to read barometric pressure.

With your altitude needle set to the correct altitude, simply read directly down the orange Index line to the corresponding barometric pressure reading. That is the current barometric pressure.

Note: To get correct barometric pressure reading, you must first have outer dial of your altimeter set to correct altitude.

Also please note: Barometric pressure is factory-set, so typically will not need adjusting. However, if you wish to fine-tune the barometric pressure reading, you may, with a screwdriver, slightly turn black screw in center of back of altimeter.

Section II: If you have OLDER “feet” model (without Index mark) or if you have any “meters” model:

Read barometric pressure reading that appears under the black indicator needle, along the **inner band** of markings. (See diagram below.)

This reading will provide real-world barometric pressure, but not the barometric pressure typically provided by weather reports, weather channels, etc. To convert this real-world barometric pressure to sea-level compensated barometric pressure, please refer to the chart below on the left (for “meters”) or the right (for “feet.”) Follow instructions printed below the chart for converting to common “weather report barometric pressure:

“Feet” version chart (Do not use if your altimeter has an orange Index mark)

Common Barometric Pressure (as if at sea-level)
Note: Read this bottom row for BAROMETRIC PRESSURE as commonly reported.

Instructions for reading chart:

1. Find your current altitude along the left column. Make sure your altimeter is adjusted to this correct altitude.
2. Move left-to-right across that row until you come to the barometric pressure closest to what’s shown on your instrument.
3. Move down that column to the bottom row of numbers. This is your sea-level compensated barometric pressure, as commonly reported.
